

Stat 992-001: Statistical methods for QTL mapping (Spring, 2011)

Homework #1: Genetic map construction

Due 28 Feb

Grab the comma-delimited data file at

`http://www.biostat.wisc.edu/~kbroman/teaching/qtltopics/hw1.csv`

This is simulated data from a backcross with 250 individuals, with 36 markers on 3 chromosomes (but I don't tell you which markers are on which chromosomes).

Construct a genetic map from these data, identifying and omitting problematic markers and individuals, forming linkage groups, ordering markers within each group, and estimating inter-marker distances.

Write a brief report describing what you did and what you found. Include figures and tables but no code—place any computer code in an appendix.
